

Problem: Let  $m \neq n$  be integers, Consider a sequence of  $m \cdot n + 1$  real numbers. Then there exists a subsequence of  $n+1$  numbers that is increasing or a subsequence of  $m+1$  numbers that is decreasing.

(ex) 101 : random 101 elements (real nos)  
 $S: a_1, a_2, \dots, a_{100}, a_{101}$  :  $101 = 10 \times 10 + 1$   
 $m = 10, n = 10$  are integers  
 11 nos that is increasing  
 or 11 no that is decreasing.

Proof: Consider  $S = a_1, a_2, \dots, a_{mn}, a_{mn+1}$  sequence of arbitrary real nos. Assume that the result is false. Let  $x \in S$  be any member  $\Rightarrow \exists$  an index  $p$  s.t. that  $a_p = x$ .

$f: (x) \rightarrow (i, j)$    
 $i \rightarrow$  length of longest subsequence in  $S$  beginning with  $x$  & increasing  
 $j \rightarrow$  length of longest subsequence in  $S$  ending with  $x$  & decreasing

$S = \underline{2} \quad \underline{6} \quad \underline{7} \quad 4 \quad 1$

$5 \rightarrow 2 \times 2 + 1$   
 $m = n = 2$

③  $\nearrow$       ③  $\searrow$

1 . . .

1 3 2 4 9

$S = \underline{17} \quad \underline{4} \quad \underline{19} \quad \underline{11} \quad \underline{12} \quad \underline{8}$   
 $\quad \quad \times \quad \quad \times \quad \quad \times \quad \quad \times$

(3) ✓ (3) ↓

$$S = \begin{array}{cccccc} \underline{17} & 4 & \underline{14} & 11 & 12 & 8 \\ & \times & \checkmark & \times & \times & \times \\ & 17 & 19 & & & \end{array}$$

$$f(2) = (3, 4)$$

$$a_1, a_2, \dots, a_m, a_{m+1}$$

$$\begin{aligned} f(a_1) &= (\alpha, \beta) \\ f(a_2) &= \\ \vdots \\ f(a_{m+1}) &= \end{aligned}$$

$$\alpha = m+1 \quad \checkmark$$

$$\beta = n+1 \quad \checkmark$$

$$\boxed{\begin{array}{l} 1 \leq \alpha \leq m \\ 1 \leq \beta \leq n \end{array}}$$

Assumption

$m+1$  numbers <sup>mn only</sup> for which the right hand side has at the most  $mn$  entries

After that there are two numbers  $a_p$  &  $a_q$  for which the function value is the same.

$$S = a_1, a_2, \dots, \boxed{a_p}, \dots, \boxed{a_q}, \dots, a_m, a_{m+1}$$

$$f(a_p) = f(a_q)$$

$$a_p < a_q \Rightarrow \#$$

$$a_q < a_p \Rightarrow \#$$

---

$$m+1 = mn+1 \quad (\text{sy. in } m+n)$$

---

$$C = [1 \ 2 \ 3 \ 4]; \quad \underline{1}x^3 + \underline{2}x^2 + \underline{3}x + \underline{4} = 0$$

roots(C);

$$C = [\underline{1} \ \underline{5} \ \underline{6}]; \quad \underline{1}x^2 + \underline{5}x + \underline{6} = 0$$

roots(C);

-3 -2

$$C = [\underline{a_n} \ \underline{a_{n-1}} \ \dots \ \underline{a_0}];$$

$$\boxed{a_n x^n + a_{n-1} x^{n-1} + \dots + a_0 = 0} \quad (1)$$

$$a_i \in \mathbb{R} \quad 0 \leq i \leq n$$

$x+iy$  as a root of (1), then  $x-iy$  is also a root.
